danielgao.au@gmail.com | (+61)402809602

## Education

---

**2025.07 - 2027.06**      **University of Technology Sydney**      **Master of Information Technology**

- **WAM (Semester 1):** 86.75 / High Distinction average

**2018.09 - 2022.05**      **Shanghai Institute of Technology**      **Bachelor of Software Engineering**

- **Awards:** Provincial Second Prize in Lanqiao Cup (Oct 2020); National Endeavor Scholarship (2020-2021); University Third-Class Scholarship (2018, 2019)
- **GPA:** 3.4/5.0 (84/100)

## Skills

---

- **Front-End:** Proficient in TypeScript, HTML, CSS, Vue, React, Vite, pnpm; experienced in optimizing rich text editors and improving first-load performance using Vite plugin-based chunk splitting.
- **Back-End:** Proficient in Java, Spring Boot, MySQL.
- **CI/CD:** Experienced in Docker, K8S, Jenkins.
- **Word API:** Experienced in developing Office 365 Word plugins using Word API for document modification and content retrieval.

## Work Experience

---

**2022.06 - 2025.07**      **Full-Stack Software Engineer**      **Alpha LifeSci Tech Co.**

**2021.01 - 2022.05**      **Full-Stack Software Engineer Intern**      **Alpha LifeSci Tech Co.**

- Participated in the design and development of the company's flagship product - a Word plugin system for clinical trial document writing. The product provides strong technical support to the pharmaceutical industry through the deep integration of AI technology. It has successfully established cooperative relationships with several well-known international pharmaceutical companies, including Johnson & Johnson, MSD, and AstraZeneca, and has received high praise and recognition from customers.
- Participated in the development of a rich-text multi-person collaborative editor system, serving as a full-stack development engineer, responsible for the development and maintenance of core features. During my tenure, I made multiple optimizations to the performance of the editor, significantly enhancing the overall performance of the product. The product has established in-depth cooperative relationships with several well-known China pharmaceutical companies.
- Responsible for maintaining and improving the team's front-end code quality, successfully migrated nearly ten thousand lines of Vue2 code to Vue3, and refactored TypeScript code, significantly reducing the use of any type, type conversion, and assertions, thereby greatly improving the maintainability of the code.

## Projects

---

**2023.10 - 2025.07**      **Word Plugin System**      **Alpha LifeSci**

**Tech Stack:** Vue, Word API, TypeScript, Large Language Models (LLMs)

## **Responsibilities and Achievements:**

- Managed medical table (TFL) synchronization in Word documents. Integrated remote data with document tables, reducing manual errors by triggering automatic synchronization when data changes. Optimized the synchronization algorithm to reduce time costs and implemented a caching layer using Pinia.
- Implemented LLM-powered Word document translation into multiple languages without style loss. Enhanced translation quality by integrating domain-specific dictionaries for optimized results.
- Developed the AI-driven one-click content generation feature for documents, including prompt engineering and customized summary generation based on client requirements. Improved AI request efficiency and accuracy.
- Contributed to AI-powered TFL summaries, improving accuracy and reducing outdated data usage. Developed full workflows for summary generation, verification, and updates.
- Handled potential abbreviation management, automatically identifying and compiling medical abbreviations in both English and Chinese.

**2022.01 - 2023.09**

**Collaborative Rich Text Document System**

**Alpha LifeSci**

**Tech Stack:** Java, Vue, TypeScript, WebSocket, WebWorker

## **Responsibilities and Achievements:**

- Developed full-stack workflows for document approval, supporting electronic signatures and read-only comments during the approval phase. Improved the approval engine to resolve data inconsistency issues in distributed systems.
- Built a custom global search feature for rich text documents with real-time results and highlights, leveraging WebWorker to reduce main thread overhead.
- Enhanced table functionality in the editor with features such as row/column operations, drag-and-drop resizing, and custom styling. Optimized performance for large tables, achieving 95% unit test coverage for stable operations.
- Developed core editor features including text selection, paragraph operations, amendment mode, and WebSocket-based communication. Resolved memory leaks and improved performance using local updates and virtual lists.
